

# SALARY SURVEY REPORT | April 2021 - June 2022

This report is focused on descriptive analysis of responses gathered from a salary survey published by "ask a manager" blogsite. Its' analysis will help to figure out what you should earn, how to negotiate it, and how much more. I went from identifying the top 3 countries by earning, and drilled it down to factors that could be responsible for that highest earning country and how salary has improved/ decreased over time.

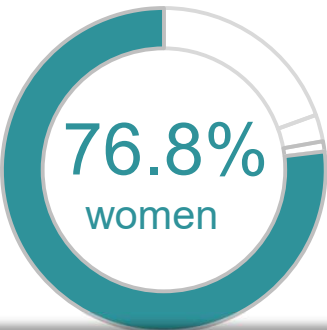

Respondents 27.5K

86.2%  
white

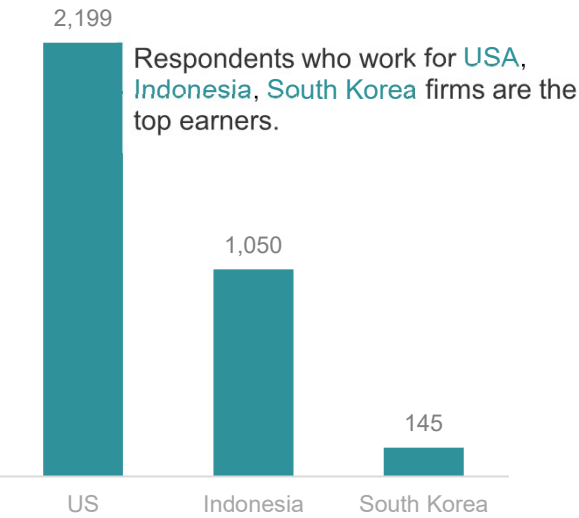

48.5%  
College degree

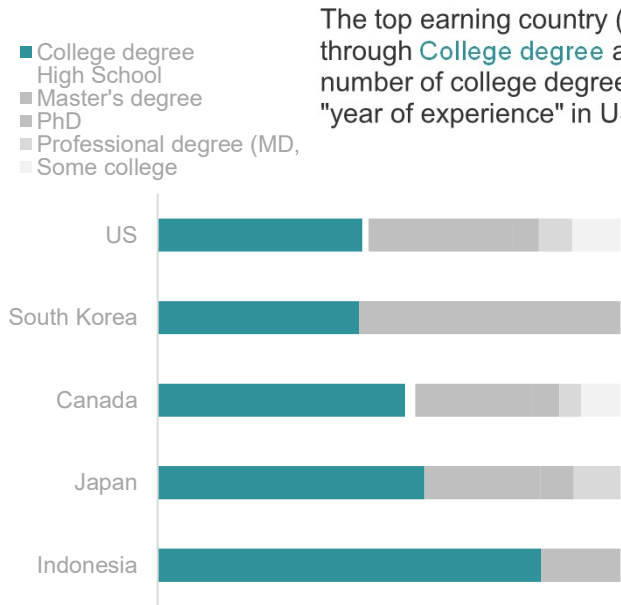

Salary by Currency

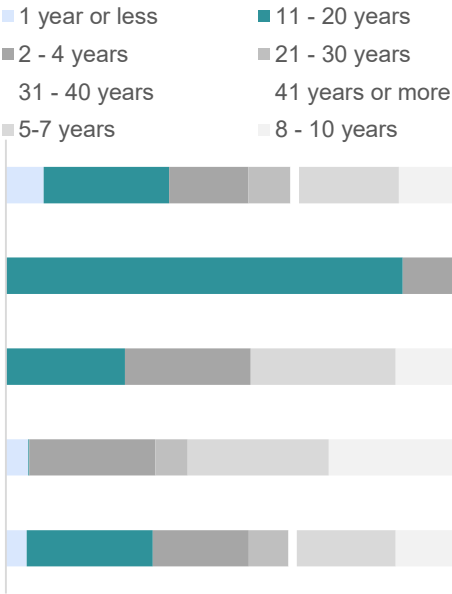

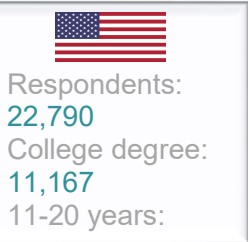

Top 3 countries by salary earnings (N' Millions).

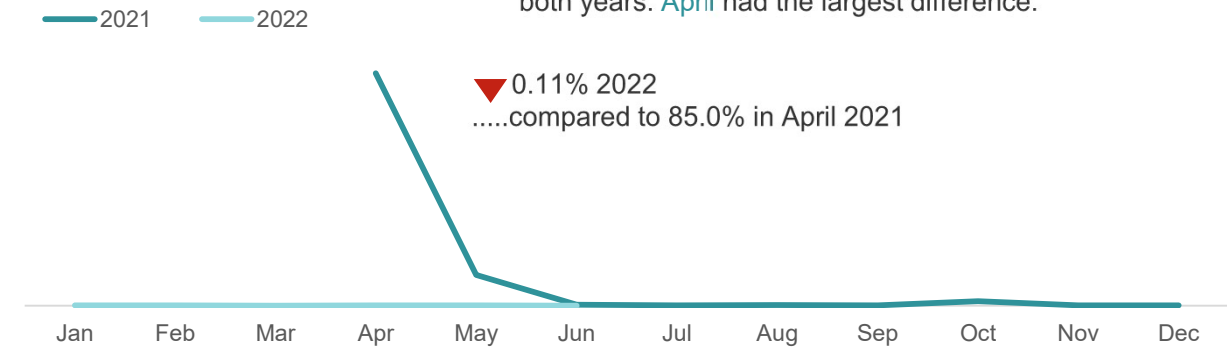

Description of US high Salary earnings

The top earning country (US) had its highest salary earning through **College degree** at over 970 Million. It had the highest number of college degree respondents. The highest earning "year of experience" in US was **11-20 years**.

Monthly trend of salary earnings

April, May, and June were the only overlapping months in both years. April had the largest difference.

## Summary

The highest earning currency was USD and US tops the list of salary earned by country with over 2 Billion dollars.

For every professional experience and educational level, US had the highest number of people and greatest salary gap compared to other countries. This survey seems biased. US had 82.8% of the total respondents. Hence, its high earning power across variables.

The survey may be useful as guidance for negotiation among US dwelling workers. For global use and comparison, it should be reviewed to cover a wider population (countries) and sample size.
